EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with John Powell on January 28, 2010.

The application has been amended as follows:

2. Claim 1: the word "endless" in line 4 is deleted.
3. The first paragraph of the specification should read: "This application is a continuation of PCT/US02/16894 filed May 30, 2002"
4. The following is an examiner's statement of reasons for allowance:
5. The closest set of prior art references are by Sirota (US 3,574,153) in view of Koehn (US 6,475,283) and Goodnow et al. (US 4,906,335)

Sirota teaches a process of applying hot melt adhesive compositions onto flexible web substrates. A pot, i.e. coater unit (10), dispenses adhesive (11) over a roller (12) and the adhesive application is controlled by a doctor blade (13) and applied to the substrate which is pulled over a pressure roller (15) (abstract; column 5, line 16 and lines 44-48). The adhesive is applied at temperature in the range of 250 °F-400 °F, or 121 °C-204 °C (column 5, lines 24-25).

Sirota does not teach applying adhesive as a multitude of lines with a coater unit having a multitude of applicators. Koehn teaches applying a patterned (strips/lines) adhesive (a, b) by means of nozzles (6) supported on a bar (5) (column 1, lines 25-31; column 3, lines 37-38; column 4, lines 5-8; Figures 1 and 2).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to perform coating as Koehn taught and would have been motivated to do so the adhesive can refrain from leakage and thus, no time consuming cleaning procedure is necessary after applications.

Furthermore, Sirota does not teach positioning a doctor blade at a certain angle tangent to the surface of a roller. Goodnow et al. teach optimizing the angle of a doctor blade against a rotating surface (column 1, lines 20-34).

Although Goodnow et al. do not specify a certain angle of the doctor blade tangent to the surface of a roller, the positioning of the doctor blade is taught so material is applied evenly and no damage or overflow can potentially occur. Therefore, it would have been obvious for one having ordinary skill in the art at the time the invention was made to use the teaching of Goodnow et al. to position a doctor blade accurately.

6. Another close set of prior art references are by Lender et al. (EP 0978263) in view of Koehn and Goodnow et al.

Lender et al. teach a process of applying hot melt adhesive compositions onto articles. A coater unit (36) dispenses adhesive on an engraved roller (31) and the adhesive application is controlled by a doctor blade (35), applied to the article (11)

applied at an average temperature 110 °C and is pulled around a roller (14) (abstract; column 9, lines 17-18; column 10, lines 45-58; column 11, lines 7-12; Figures 1 and 3).

Lender et al. do not teach applying adhesive as a multitude of lines with a coater unit having a multitude of applicators. Koehn teaches applying a patterned (strips/lines) adhesive (a, b) by means of nozzles (6) supported on a bar (5) (column 1, lines 25-31; column 3, lines 37-38; column 4, lines 5-8; Figures 1 and 2).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to perform coating as Koehn taught and would have been motivated to do so the adhesive can refrain from leakage and thus, no time consuming cleaning procedure is necessary after applications.

Furthermore, Lender et al. does not teach positioning a doctor blade at a certain angle tangent to the surface of a roller. Goodnow et al. teach optimizing the angle of a doctor blade against a rotating surface (column 1, lines 20-34).

Although Goodnow et al. do not specify a certain angle of the doctor blade tangent to the surface of a roller, the positioning of the doctor blade is taught so material is applied evenly and no damage or overflow can potentially occur. Therefore, it would have been obvious for one having ordinary skill in the art at the time the invention was made to use the teaching of Goodnow et al. to position a doctor blade accurately.

However, the prior art does not specifically teach applying adhesive beads to a substrate, where the substrate is pressed against the surface of a roller, the roller being

in close proximity to a coater, wherein the coater temperature is at least 5°C less than the temperature of the surface of a roller.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
